

Name \_\_\_\_\_

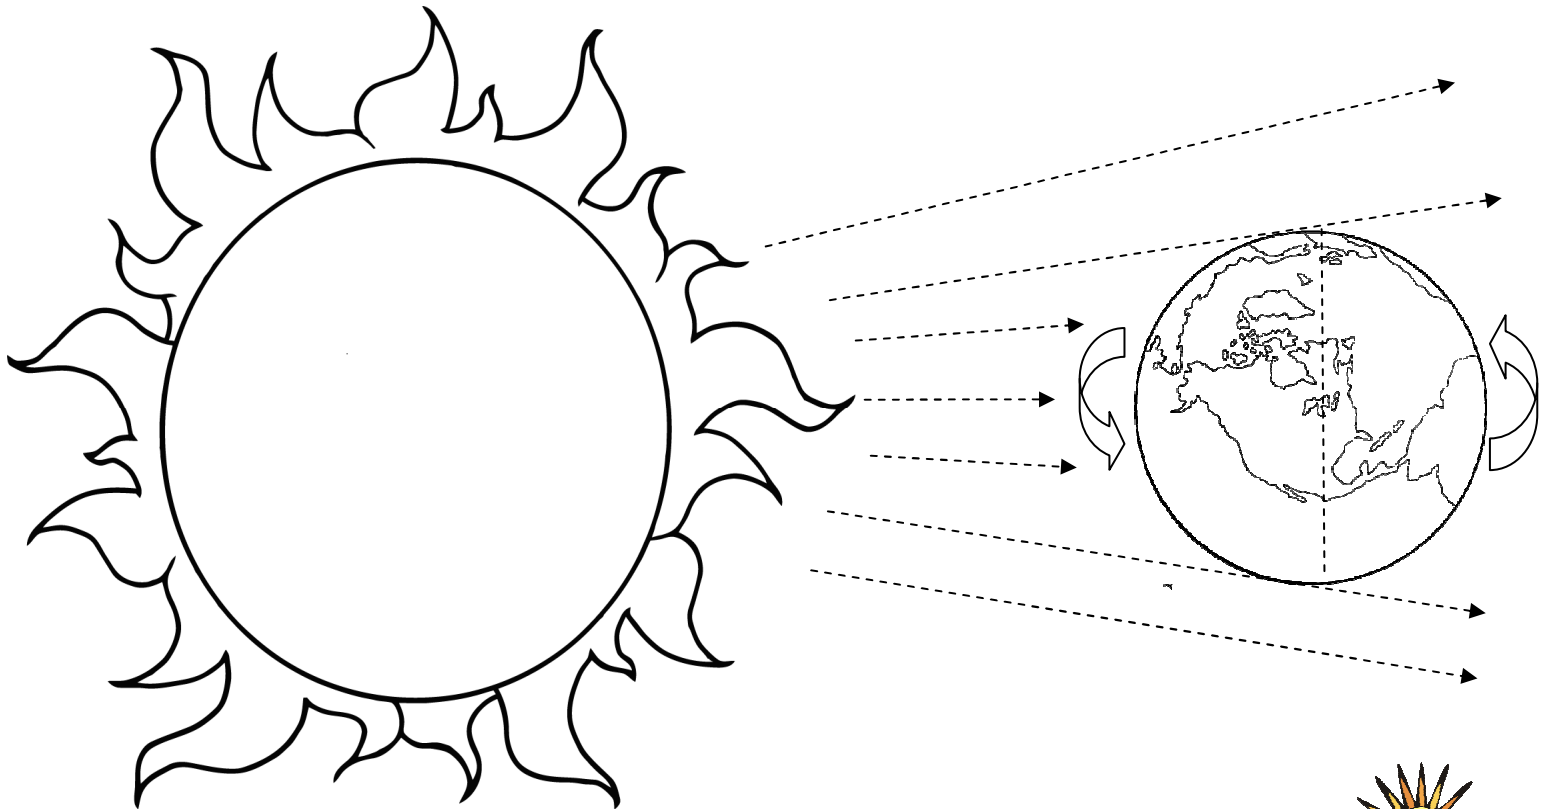

# Day and Night

The Earth does not have its own light. It is illuminated by a star, the Sun, which gives us light and heat.

Our planet is a sphere that rotates on its own axis like a top. It takes 24 hours to make a full turn. This movement marks the day and night. It is daytime in the part of the Earth facing the sun and, it is night on the opposite side of the Earth which is not receiving sunlight

1. Color of the sun yellow. Color the part of the earth where it is night black.

2. Circle the correct answer.

- The *Sun / Earth* is a star.
- The Earth completes one rotation on its axis in *1 day / 1 year*.
- In the part of the Earth that is facing the sun it is *night / day*.
