

SEQUENCING EXERCISES-ADVANCED LEVEL

Place the sentences in a logical and coherent order. Cut and paste or write in the boxes below.

Vaccinations

When administered, the immune system recognizes the antigen, interprets the type of disease and produces antibodies (defenses) to fight it.

They are usually administered through injections.

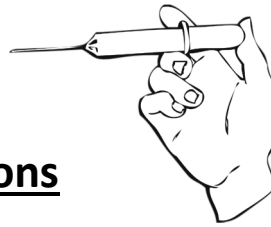

It is not mandatory to get vaccinated, but if you do not get vaccinated you run the risk of becoming seriously ill.

Vaccines are those preparations that are given to people to generate active and lasting immunity against a disease.

They are most often given to older people, children and pregnant women and travelers to countries with contagious diseases.
