

# Sources of Energy Flip Page

Wind energy is using the wind to generate electricity mainly through the use of windmills.

Water energy harnessed by dams (Hydropower) is a large source of electricity in the United States.

Oil is turned into gasoline and other petroleum products. The gasoline provides energy for our cars.

Solar energy can be converted to heat or can be converted to electricity with the use of "solar cells".

Coal is a combustible rock which means you can burn it. Almost all of the coal that we mine is used to generate electricity.

Uranium is mostly used to create nuclear power. Nuclear power creates heat which is used to generate electricity.
